# Global Cell Scale

The Cell Scale utility will allow you to globally change the scale of cells or scale the individually. When the utility is run, it will scan the design file for all of the cells and create a list based on what it finds.

Basic Use

1) Select the cell you want to modify from the list
2) Enter the scale you want all of the selected cells to be
3) Click on the "GO" button

**If you do not know the name of the cell you wish to modify, you can use the "Select Cell" button and then pick the cell. This will highlight the cell that you choose. Follow steps 2 and 3 at this time to complete the command.

**If you wish to modify all of the cells in your dgn, you can use the "All Cells" option. This option will select all of the cells, gray out the cell list and "Select Cell" button. Follow steps 2 and 3 at this time to complete the command.

Important Note If you are using custom cells in your design file, you need to make sure that your cell library is in the same path as the rest of the WSDOT cell libraries. If this command cannot find the chosen cell in that path the command will not affect the cell.
